Algorithm :

1. Start.
2. Define a node with three fields: data, left pointer, and right pointer.
3. Create a node using dynamic memory allocation.
4. Store data in the node and initialize left and right pointers to NULL.
5. Create the root node with data 1.
6. Create the left child with data 2 and the right child with data 3.
7. Create the left and right children of node 2 with data 4 and 5.
8. Display the data, left child, and right child of every node.
9. Stop.
